# Tecniche di Specifica e di Verifica

CTL\*, CTL and LTL

# CTL\* language I

- Syntax Let AP a finite set of *atomic propositions*. We define by mutual induction the following set of formulae:
  - (state formulae)
  - 0 If  $\mathbf{p} \mathbf{\hat{I}} \mathbf{AP}$ , then  $\mathbf{p}$  is a *state* formula.
  - 1 If y and y' are *state* formulae, then so are Øy and y Úy', y Ùy'.
  - 2 If y and y' are *path* formulae, then **Ey** and **Ay** are *state* formulae .

# CTL\* language I

Syntax ...

#### (path formulae)

- 3 if **y** is a *state* formula, then **y** is a *path* formula.
- 4 if  $\mathbf{y}$  and  $\mathbf{y}$ ' are *path* formulae, then so are  $\mathbf{0}\mathbf{y}$ and  $\mathbf{y}\mathbf{U}\mathbf{y}$ ',  $\mathbf{y}\mathbf{U}\mathbf{y}$ '.
- 5 if **y** and **y**' are *path* formulae, then so are **Xy** and **yUy**'.

## CTL\* semantics I

Semantics Given the standard definitions

- K = (S, S<sub>0</sub>, R, AP, L), sÎ S, L: S ® 2<sup>AP</sup> and *path* of K:  $\mathbf{p} = \mathbf{s}_0 \mathbf{s}_1 \mathbf{s}_2 \dots$  where  $(\mathbf{s}_i \mathbf{s}_{i+1})$ Î R: 0 K, s ⊨ p iff pÎ L(s).
- 1 for *propositional formulae* 
  - $-K, s \models \emptyset y$  iff *not* K,  $s \models y$
  - $-\mathbf{K}, \mathbf{s} \models \mathbf{y}_1 \ \mathbf{U} \mathbf{y}_2 \text{ iff } \mathbf{K}, \mathbf{s} \models \mathbf{y}_1 \text{ or } \mathbf{K}, \mathbf{s} \models \mathbf{y}_2.$
  - $-\mathbf{K}, \mathbf{s} \models \mathbf{y}_1 \ \mathbf{\hat{U}} \mathbf{y}_2$  iff  $\mathbf{K}, \mathbf{s} \models \mathbf{y}_1$  and  $\mathbf{K}, \mathbf{s} \models \mathbf{y}_2$ .
- 2 K,s  $\models$  Ey (K,s  $\models$  Ay) iff for some (for all) path  $\mathbf{p}=\mathbf{s} \mathbf{s}_1 \mathbf{s}_2 \dots \mathbf{s}_2 \dots \mathbf{s}_1 \mathbf{s}_2 \dots \mathbf{s$

# CTL\* semantics II

#### Semantics ...

3 K,  $\mathbf{p} \models \mathbf{p}$  iff K,  $\mathbf{s}_0 \models \mathbf{p}$ .

4 for propositional formulare

- $-\mathbf{K}, \mathbf{p} \models \mathbf{\emptyset} \mathbf{y}$  iff *not*  $\mathbf{K}, \mathbf{p} \models \mathbf{y}$
- $-\mathbf{K}, \mathbf{p} \models \mathbf{y}_1 \ \mathbf{U} \mathbf{y}_2 \text{ iff } \mathbf{K}, \mathbf{p} \models \mathbf{y}_1 \text{ or } \mathbf{K}, \mathbf{p} \models \mathbf{y}_2.$
- $-\mathbf{K}, \mathbf{p} \models \mathbf{y}_1 \stackrel{\circ}{\mathbf{U}} \mathbf{y}_2$  iff  $\mathbf{K}, \mathbf{p} \models \mathbf{y}_1$  and  $\mathbf{K}, \mathbf{p} \models \mathbf{y}_2$ .

5 temporal operators

- $-\mathbf{K},\mathbf{p} \models \mathbf{X}\mathbf{y} \text{ iff } \mathbf{K},\mathbf{p}^1 \models \mathbf{y}$
- K,p ⊧ yUy' iff for some j, K,p<sup>j</sup> ⊧ y', and for all k<j, K,p<sup>k</sup> ⊧ y

#### CTL language definition

CTL can be defined as the *sub-labguage* of CTL\* by replacing items 3-5 of the above definition, by the following:

3' if **y** and **y**' are *state* formulae, then **Xy** and **yUy**' are *path* formulae.

#### LTL, CTL and CTL\*

LTL (state):  $\mathbf{j} ::= \mathbf{A} \mathbf{y}$ (path):  $\mathbf{y} ::= p \frac{1}{20} \mathbf{y} \frac{1}{2} \mathbf{y}_1 \mathbf{U} \mathbf{y}_2 \frac{1}{2} \mathbf{X} \mathbf{y} \frac{1}{2} \mathbf{y}_1 \mathbf{U} \mathbf{y}_2$ CTL (state):  $\mathbf{j} ::= p \frac{1}{20} \mathbf{j} \frac{1}{2} \mathbf{j}_1 \mathbf{U} \mathbf{j}_2 \frac{1}{2} \mathbf{E} \mathbf{y}$ 

(path):  $y ::= X j \frac{1}{2} j_1 U j_2$ 

CTL\* (state):  $\mathbf{j} ::= p \frac{1}{20} \mathbf{j} \frac{1}{2} \mathbf{j}_1 \mathbf{U} \mathbf{j}_2 \frac{1}{2} \mathbf{E} \mathbf{y}$ (path):  $\mathbf{y} ::= \mathbf{j} \frac{1}{20} \mathbf{y} \frac{1}{2} \mathbf{y}_1 \mathbf{U} \mathbf{y}_2 \frac{1}{2} \mathbf{X} \mathbf{y} \frac{1}{2} \mathbf{y}_1 \mathbf{U} \mathbf{y}_2$ 

#### LTL and CTL\*

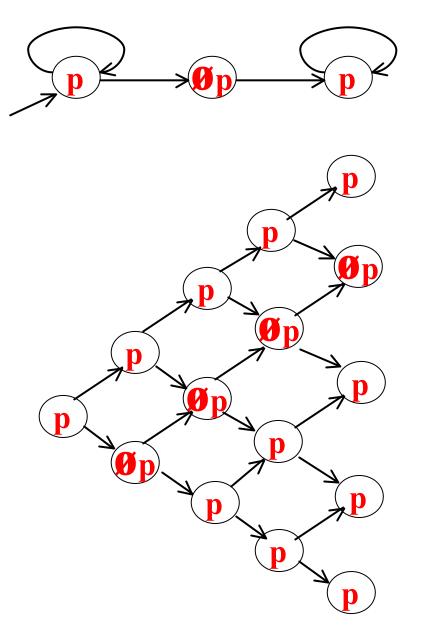

Theorem:[Clarke] For every CTL\* formula
y, an equivalent LTL (it it exists) must be of the form Af(y) where f(y) is equal to y with all the path quantifiers eliminated.

# LTL vs CTL

In LTL, we could write: **A FG** p, which means "on all paths, there is some state from which p will forever hold" (i.e.  $\bigcirc p$  holds finitely often).

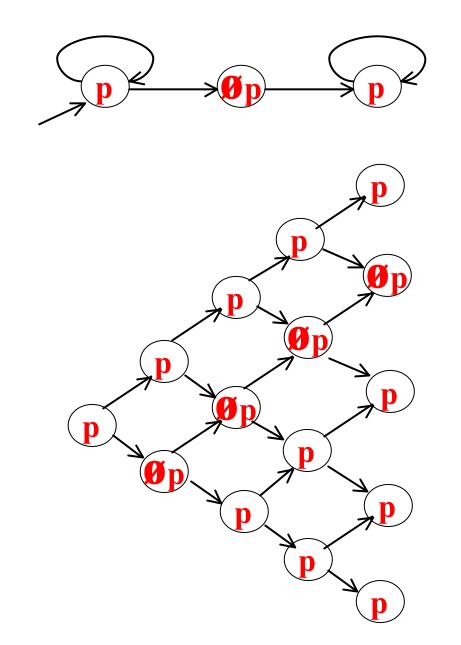

# There is no equivalent of this LTL formula in CTL.

For example, in the following model,  $\mathbf{A} \mathbf{F} \mathbf{G} \mathbf{p}$  holds, but the formula  $\mathbf{A} \mathbf{F} \mathbf{A} \mathbf{G} \mathbf{p}$  does not.

# LTL vs CTL

Similarly the LTL formula  $AF(p \ U \ X \ p)$  has no equivalent in CTL. Two attempts are:  $AF(p \ U \ AX \ p)$ But in the model on the right, the LTL formula is true while the CTL formula is false

# LTL vs CTL

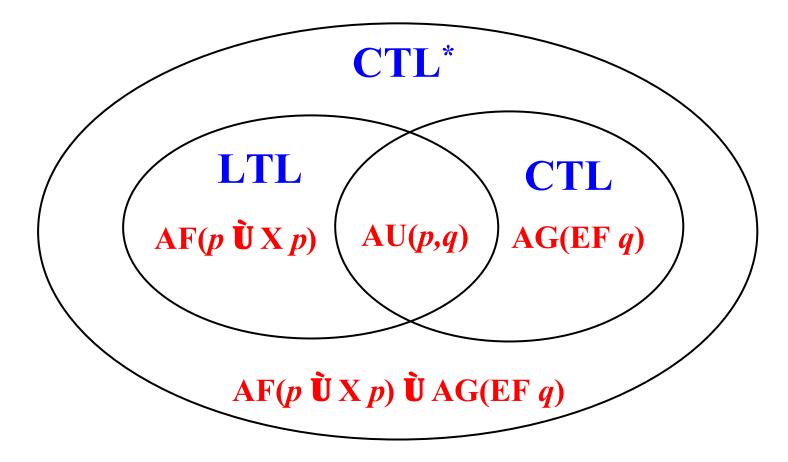

Similarly the LTL formula  $AF(p \ U \ X \ p)$  has no equivalent in CTL. Two attempts are:  $AF(p \ U \ AX \ p)$ and  $AF(p \ U \ EX \ p)$ But in the model on the right, the LTL formula is

false while the second CTL

formula is true.

Ø

## LTL vs CTL vs CTL\*

## LTL vs CTL vs CTL\*

- A GF j is a LTL formula which *can be expressed* in CTL by the *equivalent* formula AG AF j.
- For any j and y the LTL formula A(GF j ® y) is *not expressible* in CTL, in particular it is *not equivalent to* ((AG AF j) ® y).
- In other words, *fairness constraints cannot be expressed* directly in CTL.
