Motivations

CSS Rapid

Prototyping

Experimental setup

- ▶ This hand-on session focuses on:
 1. PF Current Control
 2. Plasma Current Control
 3. Plasma Shape Control (in an *XSC-flavor*)
- ▶ The JET tokamak will be considered
- ▶ We will assume the plasma is vertically stabilized on a faster timescale (wrt the current and shape control time scale)

CSS Rapid Prototyping

Experimental setup

The linearized plasma model used in this session is

$$\delta\dot{x} = A\delta x + B\delta u$$

$$\delta y = C\delta x$$

where the state and input vectors are given by

$$\delta x = \begin{pmatrix} \delta I_{PF} \\ \delta I_p \end{pmatrix} \quad \text{and} \quad \delta u = \begin{pmatrix} \delta V_{PF} \\ \delta V_p \end{pmatrix}$$

- ▶ δI_{PF} , δV_{PF} are the PF current and voltage variations
- ▶ δI_p , δV_p are the plasma current and loop-voltage variations

Outline

Introduction

PF Current Controller

Plasma Current Controller

Shape Controller

Rapid prototyping of control systems

Motivations

CSS Rapid Prototyping

Experimental setup

The output vector is equal to

$$\delta y = \begin{pmatrix} \delta I_{PF} \\ \delta I_p \\ \delta g \end{pmatrix}$$

where δg holds the plasma shape descriptors, i.e.

- ▶ gaps
- ▶ strike-points
- ▶ x-points

- Shape Controller

Rapid prototyping of control systems

Motivations

- CSS Rapid Prototyping
- Experimental setup

The 9 currents in the PF coils are

- ▶ I_{P1} - current in the $P1$ circuit
- ▶ I_{P4T} - current in the $P4$ circuit
- ▶ I_{IMB} - imbalance current in the $P4$ circuit
- ▶ I_{PFX} - current in the FX circuit
- ▶ I_{SHP} - current in the shaping circuit
- ▶ $I_{D1}, I_{D2}, I_{D3}, I_{D4}$ - currents in the divertor coils

Outline

Plasma Magnetic Control Design

Introduction

- PF Current Controller
- Plasma Current Controller
- Shape Controller

Rapid prototyping of control systems

Motivations

- CSS Rapid Prototyping
- Experimental setup

- ▶ SC generates current references
- ▶ A PF currents controller must be designed

Outline

Plasma Magnetic Control Design

Introduction

PF Current Controller

Plasma Current Controller

Shape Controller

Rapid prototyping of control systems

Motivations

CSS Rapid Prototyping

Experimental setup

Plasmaless model

$$\mathbf{V}_{PF} = \begin{bmatrix} L_1 & M_{12} & \dots & M_{1N} \\ M_{12} & L_2 & \dots & M_{2N} \\ \dots & \dots & \dots & \dots \\ M_{1N} & M_{2N} & \dots & L_N \end{bmatrix} \frac{d\mathbf{I}_{PF}}{dt} + \begin{bmatrix} R_1 & 0 & \dots & 0 \\ 0 & R_2 & 0 & 0 \\ \dots & \dots & \dots & \dots \\ 0 & 0 & \dots & R_N \end{bmatrix} \mathbf{I}_{PF}$$

Resistive compensation

$$\mathbf{V}_{PF_{ref}} = \hat{\mathbf{R}}\mathbf{I}_{PF} + \mathbf{K}(\mathbf{Y}_{ref} - \mathbf{Y})$$

Static relationship between PF coils current and controlled variables

$$\mathbf{Y} = \mathbf{T}\mathbf{I}_{PF}$$

Control Matrix

$$\mathbf{K} = \hat{\mathbf{M}}\mathbf{T}^{-1}\mathbf{\Lambda}^{-1} \text{ with } \mathbf{\Lambda} \text{ diagonal matrix}$$

Outline

Motivations

CSS Rapid Prototyping

Experimental setup

Closed-loop system

$$\begin{aligned} \mathbf{MT}^{-1}\dot{\mathbf{Y}} + \mathbf{RI}_{PF} &= \mathbf{MT}^{-1}\Lambda^{-1}(\mathbf{Y}_{ref} - \mathbf{Y}) + \mathbf{RI}_{PF} \Rightarrow \\ \Rightarrow \dot{\mathbf{Y}} &= \Lambda^{-1}(\mathbf{Y}_{ref} - \mathbf{Y}) \end{aligned}$$

By a proper choice of the \mathbf{T} matrix it is possible to achieve:

- ▶ current control mode
- ▶ plasma current control mode
- ▶ gap control mode

Outline

Plasma Magnetic Control Design

Introduction

PF Current Controller

Plasma Current Controller

Shape Controller

Rapid prototyping of control systems

Motivations

CSS Rapid Prototyping

Experimental setup

A simplified model of the plasma current circuit is considered

- ▶ plasma resistance is neglected
- ▶ only the mutual inductance with the $P1$ circuit is retained

The following broadly valid linear model can be derived

$$\dot{i}_p(t) = -c i_{P1}(t), \quad \text{with } c > 0.$$

Outline

Plasma Magnetic Control Design

Introduction

PF Current Controller

Plasma Current Controller

Shape Controller

Rapid prototyping of control systems

Motivations

CSS Rapid

Prototyping

Experimental setup

- ▶ The *eXtreme Shape Controller (XSC)* controls the whole plasma shape, specified as a set of **32** geometrical descriptors, calculating the PF coil current references.
- ▶ Let $\mathbf{I}_{PF_N}(t)$ be the PF currents normalized to the equilibrium plasma current, it is

$$\delta \mathbf{g}(t) = \mathbf{C} \delta \mathbf{I}_{PF_N}(t).$$

It follows that the plasma boundary descriptors have the same dynamic response of the PF currents.

- ▶ The XSC design has been based on the \mathbf{C} matrix. Since the number of independent control variables is less than the number of outputs to regulate, it is not possible to track a generic set of references with zero steady-state error.

$$\delta \mathbf{I}_{PF_{Nreq}} = \mathbf{C}^\dagger \delta \mathbf{g}_{error}$$

PF Current Controller

Plasma Current Controller

Shape Controller

Rapid prototyping of control systems

Motivations

CSS Rapid Prototyping

Experimental setup

- ▶ The XSC has then been implemented introducing weight matrices both for the geometrical descriptors and for the PF coil currents.
- ▶ The determination of the controller gains is based on the Singular Value Decomposition (SVD) of the following weighted output matrix:

$$\tilde{\mathbf{C}} = \tilde{\mathbf{Q}} \mathbf{C} \tilde{\mathbf{R}}^{-1} = \tilde{\mathbf{U}} \tilde{\mathbf{S}} \tilde{\mathbf{V}}^T,$$

where $\tilde{\mathbf{Q}}$ and $\tilde{\mathbf{R}}$ are two diagonal matrices.

- ▶ The XSC minimizes the cost function

$$\tilde{J}_1 = \lim_{t \rightarrow +\infty} (\delta \mathbf{g}_{ref} - \delta \mathbf{g}(t))^T \tilde{\mathbf{Q}}^T \tilde{\mathbf{Q}} (\delta \mathbf{g}_{ref} - \delta \mathbf{g}(t)),$$

using $\bar{n} < 8$ degrees of freedom, while the remaining $8 - \bar{n}$ degrees of freedom are exploited to minimize

$$\tilde{J}_2 = \lim_{t \rightarrow +\infty} \delta \mathbf{I}_{PFN}(t)^T \tilde{\mathbf{R}}^T \tilde{\mathbf{R}} \delta \mathbf{I}_{PFN}(t).$$

(it contributes to avoid PF current saturations)

Rapid prototyping of control systems

- Motivations
- CSS Rapid Prototyping
- Experimental setup

The traditional development cycle of control systems follows the **three** phases:

- ▶ design
- ▶ implementation
- ▶ testing

Motivations

CSS Rapid Prototyping
Experimental setup

Outline

Plasma Magnetic Control Design

Introduction
PF Current Controller
Plasma Current Controller
Shape Controller

Rapid prototyping of control systems

Motivations

CSS Rapid Prototyping
Experimental setup

- ▶ the design phase ends with the functional requirement specification;
- ▶ the implementation phase starts with the software requirements;
- ▶ the test and validation phase is **mainly carried out on-site**.

Due to the additional efforts and costs, often the architectural design is carried out without any modeling and simulation support.

However, if

- ▶ the system to be controlled is *non-conventional* or new;
- ▶ the required performances are very demanding;
- ▶ the plant is not yet available and/or the testing on-site is very risky;

then the use of modeling and simulation tools during the design phase becomes highly recommended.

CSS Rapid

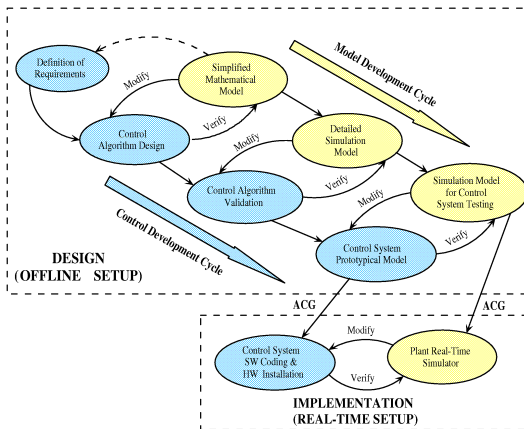

Prototyping

Experimental setup

Design aided with modeling, simulation and rapid prototyping tools

For the design and development of a critical system, it is more appropriate to resort to modeling, simulation and rapid prototyping tools.

 Plasma Current Controller
 Shape Controller

Rapid prototyping of control systems

Motivations

CSS Rapid Prototyping
 Experimental setup

- The proposed approach is based on the availability of
- ▶ several plant models (at different level of details)
 - ▶ **automatic tools** for the rapid prototyping of both control systems and plant models

Two operational setups have been provided

- ▶ the *offline setup* to perform the design of the control system,
- ▶ the *real-time setup* where to perform test and validation with hardware-in-the-loop (HIL) simulations.

Rapid prototyping of control systems

- Motivations
- CSS Rapid Prototyping
- Experimental setup

- ▶ A simplified model of both the plant (CSS-OPS) and of the controller (CCS-PROT) have been developed in the Matlab/Simulink environment.
- ▶ Exploiting the **Labview Simulation Interface Toolkit (SIT)** we:
 - ▶ Develop a common Human-Machine Interface both for the *offline* and for the *real-time* (that can be accessed even remotely, thanks to a web server application)
 - ▶ Deploy the plant on a PXI Real-Time target to perform HIL simulations with a PLC-based controller
