

# Model-based design and validation of control systems

December 11, 2009

December 11, 2009 - ITER Plasma Control Workshop

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

G. De Tommasi<sup>1</sup> A. Neto<sup>2</sup> F. Sartori<sup>3</sup> L. Zabeo<sup>4</sup>  
and EFDA-JET PPCC contributors

## Motivations

## Standardization of RT control systems

## Model-based Design and Validation

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

## Main aim

**Reduction of the time needed for commissioning on the machine**

## “Tools”

- ▶ Standard architecture for real-time control systems
  - ▶ Complete separation between the algorithmic part of a real-time application from the plant-interface software
  - ▶ Multi-platform development environment
- ▶ **Massive offline validation against plant models**

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

## Why we want to separate application from infrastructure software?

Defining a standard API for real-time control application we:

- ▶ Scientist (process experts) can abstract from the plant interfaces
- ▶ Increase code reusability
- ▶ Standardization (I)

Outline

Motivations

Standardization

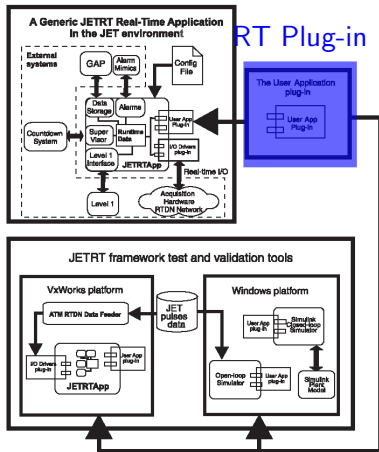

Model-based  
Design and  
Validation

# Real-time application plug-in

As a result we have a **Real-time Application Plug-in** that can be used to:

- ▶
- ▶
- ▶

RT Plug-in

Outline

Motivations

Standardization

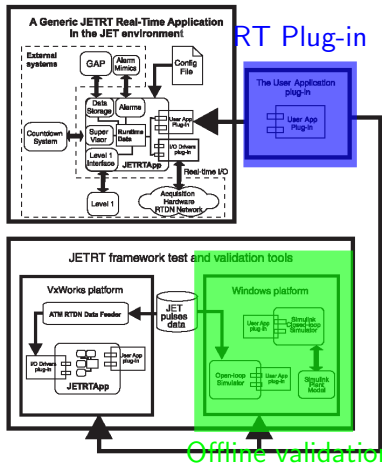

Model-based Design and Validation

# Real-time application plug-in

As a result we have a **Real-time Application Plug-in** that can be used to:

- ▶ perform offline validation against a plat model
- ▶
- ▶

RT Plug-in

Offline validation

Outline

Motivations

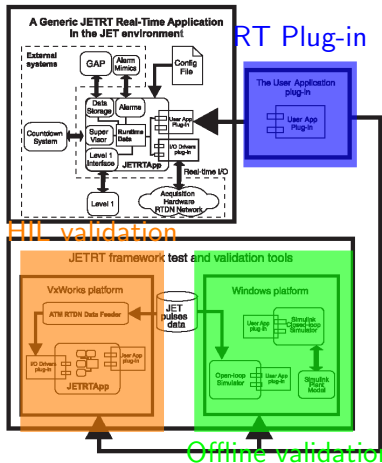

Standardization

Model-based Design and Validation

As a result we have a **Real-time Application Plug-in** that can be used to:

- ▶ perform offline validation against a plat model
- ▶ perform real-time validation with hardware-in-the-loop
- ▶

Motivations

Standardization

Model-based Design and Validation

# Real-time application plug-in

Outline

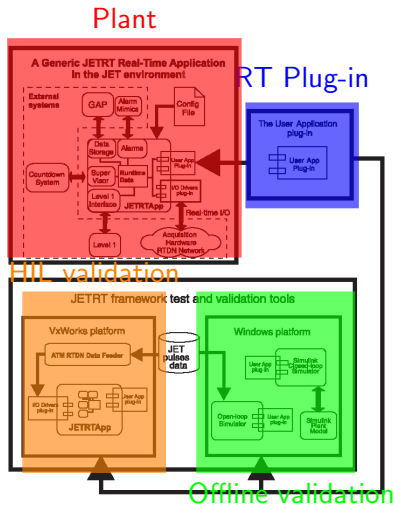

Motivations

Standardization

Model-based Design and Validation

As a result we have a **Real-time Application Plug-in** that can be used to:

- ▶ perform offline validation against a plant model
- ▶ perform real-time validation with hardware-in-the-loop
- ▶ run the real-time system on the plant

## Why we want a portable framework?

- ▶ Real-time applications can be tested offline on standard office devices (Intel/Windows) ( $\Rightarrow$  sensible reduction of time needed for commissioning)
- ▶ A large range of platforms can be supported:
  - ▶ *High performance* and *Standard* platforms
  - ▶ *Prototypes* and *COTS* platforms
  - ▶ *Open source* and *Closed source*
  - ▶ ...
- ▶ Standardization (II)

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

## Modelling helps you ...

- ▶ to **define** control system **requirements**
- ▶ to **design** the control algorithms
- ▶ to **make performance analyses**
- ▶ to **validate real-time implementation** of the control systems
- ▶ to perform **offline analyses** to forecast experimental behaviour

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

When system requirements have to be defined, the development of a **simplified** plant model

- ▶ forces the definition of I/O (interfaces)
- ▶ helps the definition of the *operational scenarios*
- ▶ gives the possibility to define non-envisaged situations
- ▶ can be used to formally define the system requirements
- ▶ This task is performed by using offline environments
- ▶ Rapid prototyping techniques can be used to product a prototype of the control system
- ▶ Hardware-in-the-loop (HIL) simulations can be performed to do a preliminary performance assessment

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

**Detailed** models must be developed

- ▶ to design control algorithm
- ▶ to assess control system performance

This task is performed by using offline environments  
(Matlab/Simulink...)

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

**Real-time version** of (simplified) models can be effectively used

- ▶ to perform offline *live* debug of the software implementation
- ▶ to perform offline validation of control system with or without hardware-in-the-loop

Given a **multi-platform modular framework**, two possible *approaches*

1. The real-time control application plug-in can be validated offline in a simulation environment (e.g. Matlab/Simulink)
2. A plant model plug-in can be added in the plant system

Outline

Motivations

Standardization

Model-based  
Design and  
Validation

- ▶ Models are essential for the design of control algorithm, but there is something more. . .
- ▶ . . .before the design phase, models can help you to define system requirements. . .
- ▶ . . .after the design phase, models help you to test and validate the real control system

You need a SW/HW architecture that allows you

- ▶ to test the real-time application in a simulation environment
- ▶ and/or to embed the (simplified) plant model into the real-time system
