Corso di *Applicazioni Telematiche*
Prof. Roberto Canonico

Università degli Studi di Napoli Federico II
Facoltà di Ingegneria
Roadmap

- **Part I:**
  - History, background and state of the art
    - Conferencing as a service
    - Standardization approaches
    - Related topics
      - Media control
  - Media control

- **Part II:**
  - Hands-on conferencing
    - Ongoing activities at the University of Naples
      - CONFIANCE & DCON projects
    - Contribution to standards
    - Implementation efforts
    - Open issues
Conference

- The term “Conference” can be used to describe any meeting of people that “confer” about a certain topic.
- Web Conferencing is used to conduct live meetings or presentations over the Internet.
Features

- Voice over IP
- Live video
- Text chat
- Slide presentations
- Whiteboard with annotation
- Screen/desktop sharing
- Application sharing
- Recording
- Polls and surveys
History

- Tele-Conferencing
  - Conference calls (Audio Tele-Conferencing)
  - Video conferences (Video Tele-Conferencing)

- Web Conferencing
  - Text Conferencing
  - Audio/Video Conferencing
  - Data Conferencing
Audio Tele-Conferencing (ATC)

- Analog Phone Lines (PSTN)
  - Conference calls
    - Three-way calling
    - Conference bridges

- Digital Telephony (ISDN)
  - ITU-T H.320 umbrella recommendation

- IP-based Tele-Conferencing
  - Real-time Transfer Protocol (RTP)
  - Voice over IP (VoIP)
Video Tele-Conferencing (VTC)

- Closed-circuit television systems
- Radiofrequency (UHF or VHF) links
- Mobile links to satellites
- Analog phone lines (PSTN)
  - Videotelephony (AT&T PicturePhone)
- Digital Telephony (ISDN)
  - ITU-T H.320 Umbrella Recommendation
  - Multipoint Videoconferencing (MCU)
- IP-based Videoconferencing
  - Better video-compressing technologies
Text Conferencing

- Asynchronous Meetings
  - Posted text messages (not live)
    - Message/Bulletin Boards
    - Fora/Forums
    - Network news groups/Mailing lists
Text Conferencing

- **Synchronous (Live) Meetings**
  - Live text communication
    - `talk/ntalk/ytalk` (Unix)
    - Internet Relay Chat (IRC)
    - Web-based Chat (CGI/Java)
    - Instant Messaging (Skype/MSN/ICQ/XMPP/SIMPLE/etc.)
Data Conferencing

- Participants sharing computer data in real time
  - Text (Instant Messaging)
  - Audio/Video
  - Screen/Documents/Graphics/Applications

- Desktop Systems
  - Placeware/ProShare/Databeam
  - Netmeeting/Gnomemeeting
  - Skype/AIM/ICQ/MSN/Yahoo/etc.
Typical Scenarios

- Point-to-Point Calls to Multipoint Calls
  - Three-way calling
  - Coaching scenario

- Lecture-mode Conferences
  - Presentation
  - Question & Answers session

- Ad-hoc and Reserved Conferences
  - Conference-aware/-unaware participants
    - Manage conference/users/media/policies
    - Sidebars/Whispers
Issues

- **Call Signaling**
  - Gateway functionality

- **Control and Management**
  - Tone detection (DTMF)
  - Dedicated protocols

- **Mixing and Transcoding**
  - Terminal capabilities
  - User media profiling
  - Coaching scenario
  - Videoswitching
Standardization Efforts

- No standardization for many years
  - Lack of interoperability
  - Platform dependency
  - Security issues
  - Cost
  - Market segmentation
- Standardization Bodies
  - ITU (International Telecommunication Union)
  - IETF (Internet Engineering Task Force)
  - 3GPP (3rd Generation Partnership Project)
Standardization Efforts: ITU

- Established to standardize and regulate international radio and telecommunications
- International Standards referred to as Recommendations”
- ITU-T: Telecommunication Sector
  - G: Transmission Systems and Media
    - G.71x (Audio compression, mu-law and a-law)
    - G.72x (Audio compression, ADPCM)
  - H: Audiovisual and Multimedia Systems
    - H.320 (PSTN/ISDN, Telephone Systems)
    - H.323 (IP, Packet-based Communication Systems)
  - T: Terminals for Telematic Services
    - T.120 (Data Sharing Protocols)
    - T.140 (RTP Interactive Text)
Standardization Efforts: IETF

- Under the umbrella of the Internet Society
- Develops and promotes Internet Standards
- Deals in particular with standards of the TCP/IP suite

Organization

- Working Groups (WG)
- Internet Drafts
- Requests for Comments (RFC)
- “Rough consensus, running code”
SIPPING Working Group

- Session Initiation Proposal Investigation
- Documents the use of SIP for several applications related to telephony and multimedia
- SIP Conferencing

Loosely-Coupled Conference

Fully Distributed Multiparty Conference

Tightly-Coupled Conference

SIP Conferencing Framework (RFC 4353): fundamental elements

- Focus
- Policy Server
- Mixer
- Notification Service (Event Package, RFC 4575)
- Participants
Centralized Conferencing (XCON)
Extends RFC 4353
- Protocol-agnostic (not only SIP)
- Data Sharing (not only audio/video)

Suite of Protocols
- Conference Control (CCMP)
- Floor Control (BFCP)
- Call Signaling (SIP/H.323/IAX/etc.)
- Notification (Event Package?)
XCON Framework
Conference Control Protocol

- Create/Manage/Schedule/etc. Conferences
- Several candidates in the past, all rejected
- New proposal
  - Centralized Conferencing Manipulation Protocol (CCMP)
    - State-less client-server protocol
    - Based on a request/response model
      - Uses HTTP as the protocol to transfer messages
- University of Naples (COMICS research group):
  - Highly active in this field
  - Running code 😊 and... eventually rough consensus 😊
Floor Control Protocol

- Coordinates access to set of shared resources
  - A “Floor” is a token, a temporary permission to access or manipulate a specific shared resource or set of resources

- Binary Floor Control Protocol (BFCP)
  - Standardized in RFC 4582
    - Identifiers (Conferences/Floors/Users)
    - Floor Control Server
    - Floor Control Participant
      - Floor Chair
  - Only existing implementation to date: COMICS/Ericsson
  - Negotiation of BFCP connections within SIP/SDP standardized in RFC 4583
BFCP

1) Floor Request
2) Notify
3) Chair decision
4) Decision
5) Floor Granted/Denied
6) Notify
MEDIACTRL Working Group

- Media Server Control
  - Media Processing
    - Mixing/Transcoding
    - Playing/Recording
    - Storing/Retrieving
    - Detecting Tones (DTMF)
  - Interactive Voice Response (IVR)/VoiceXML
  - Text-to-Speech/Speech Recognition
- RTP Streams Manipulation
- Of great interest to the XCON working group
- MRFC/MRFP (interface/container) in IMS
CONFIANCE

CONferencing IMS-enabled Architecture for Next-generation Communication Experience

Open source prototype implementation of the XCON Framework, compliant with the IMS specification

Extends the Asterisk PBX functionality

- Enhanced “MeetMe” application
- Support for Conference Management (CCMP)
- Support for Floor Control (BFCP)
  - BFCP-guided audiomixing
  - BFCP-guided videomixing
Asterisk PBX

- Open source Private Branch eXchance (PBX)
- Advanced features
  - Highly configurable dialplan
  - Modular architecture
    - Channel API
      - SIP channel driver
    - Application API
      - MeetMe conference bridge
    - Codec and File Format API
      - Audio transcoding
      - Video passthrough
  - Remote Manager Interface
Definiton of a single extension with name "123".

```
exten => 123,1,Answer
exten => 123,2,Playback(tt-weasels)
exten => 123,3,Voicemail(44)
exten => 123,4,Hangup
```

When a call is made to extension 123, Asterisk will answer the call itself, play a sound file called "tt-weasels", give the user an opportunity to leave a voicemail message for mailbox 44, and then hangup.

**Extension Patterns**

A single extension can also match *patterns*. In the `extensions.conf` file, an extension name is a pattern if it starts with the underscore symbol (_).

```
exten => _123.,1,Answer
exten => _123.,2,Playback(tt-weasels)
exten => _123.,3,Voicemail(${EXTEN})
exten => _123.,4,Hangup
```
XCON through MeetMe

extensions.conf

 [...] 

; XCON through MeetMe: example of wildcards to add flexibility
; - First 7 numbers = conference
; - Next (1-4) numbers = PIN (Phone PIN, not Admin's password)
;
; the 'B' flag tells MeetMe this is an XCON conference (B => BFCP)
;
  exten => _857.,1,Meetme(${EXTEN:0:7}|B|${EXTEN:7})
  exten => _857.,2,Hangup

[...]
CONFIANCE in IMS
CONFIANCE Use Case

Participant (Client) <-> Focus (Server)

SIP/IAH/H323/PSTN etc.
Conference Control Protocol
Binary Floor Control Protocol

Query Conferences (Active)
Info Conferences (Active Conferences list)
SIP call to number 867100 (to join conference 867100)
IVR-based messages (Welcome, Muted Status, etc.)
SIP re-INVITE (BFCP info encapsulated in SDP body)
Floor Request
Floor Request Status (Pending)
Forward the request to the Chair
Chair Decision

Notify Chair Decision
Coffee break?
Distributed Conferencing

- Centralized Conferencing being standardized
  - Poorly scalable
  - Limited capabilities
  - Single point of failure

- Distributed Conferencing
  - Cascaded Conferencing
    - Each focus is seen as a participant by the others
    - Only affects mixers' distribution
    - Centralized protocols like BFCP don't work
  - P2PSIP Working Group
    - Has not dealt with conferencing yet
Centralized conferencing

Server 1: N clients
Cascaded Conferencing

Server 1: N/2 clients

Server 2: N/2 clients
Distributed Conferencing (DCON)
- Explicitly recalls XCON
  - Orchestrates the operation of a set of XCON focus elements, called “clouds”
  - Overlay network interconnecting the clouds
- Intra-focus communication
  - Still based on XCON protocols
- Inter-focus communication
  - Exploits Server-to-Server (XMPP)
DCON architecture
Requirements

- Focus discovery
- Initialization information & spreading of conference events
- Setup and managing of distributed conferences
- Transparent dispatching of natively centralized protocols among the involved conferencing clouds
DCON Implementation

![Diagram showing DCON implementation with focus on inter-focus communication and media flow between DCON Focus A and DCON Focus B.]
We suppose CONFIANCE is working

When the DCON component starts, 3 main events happen:
1) Connection to the Asterisk Manager interface
2) Connection to the Gateway interface
3) Request for initialization information

Now the focus cloud involves also the Wildfire server and SPACE component which has in charge:
1) Discovery of other foci
2) Managing of DCON information and BFCP packets.
DCON focus discovery
We suppose that the roster of user A_1 (belonging to focus A) contains user B_1 (belonging to focus B) and viceversa.

Once an user (we suppose B_1) joins the focus, the Presence Manager enforces the S2S Manger to try to contact all the foci in the B_1’s roster.

Two cases are possible…
Discovery of active Foci
Case 1: A_1 not yet online

If A_1 (the user in B_1 roster) is not yet online the focus A will appear “not active” until A_1 will join it.
Once A_1 joins the focus, in fact, the Presence Manager enforces the S2S Manager to try to contact B.

In such a way the s2s connection is complete and the foci can exchange their conference information by means of an XMPP encapsulated “update message” and add the prefix of the remote focus to the local Asterisk Dialplan.
Asterisk dialplan: remote prefix

extrn => _857.,1,Meetme(${EXTEN:0:7}|B|${EXTEN:7})
extrn => _857.,2,Hangup

extrn => _867.,1,Meetme(${EXTEN:0:7}|G|${EXTEN:7})
extrn => _867.,2,Hangup
Discovery of active Foci
Case 2: A_1 is already online

If A_1 (the user in B_1 roster) is already online the focus A will appear “active”

So the s2s connection is complete and the foci can exchange their conference information by means of an XMPP encapsulated “update message” and add the prefix of the remote focus to the Asterisk Dialplan.
DCON: spreading of conference events
When the s2s connection has been established and the prefixes have been exchanged every local event is spread to the remote connected foci.

We suppose A_1 registers the new local conference 8671000 by means of the CCP: a “RegisteredEvent” will be sent to SPACE by means of the Manager Interface.

SPACE will then spread it to all the active foci which will update their information.
If A_1 joins the local conference 8671000 an “ActivateEvent” will be sent to SPACE by means of the Manager Interface.

SPACE will then spread it to all the active foci which will update their information.
DCON and CCP
If User B_1 wants to know the conferences active in the distributed system, he/she can send a “QueryActiveConferences” message.

The Gateway checks if DCON is connected and in this case asks it for the conference information about all the active foci.

The user is so aware of the conference 8671000 active on the remote focus A.
DCON: remote conference join
If now the user B_1 wants to join the remote conference 8671000, he/she simply calls this conference number.

The Gateway checks the prefix and understands this is a remote conference so:

1) Triggers the creation of the Local Stub Conference 8671000

2) Sends the AddCascaded and AddUser messages to the remote focus by means of the dispatcher
The main focus adds the Cascaded conference, sends a CascadedAdded message. Two RTP channels (Audio and Video) are opened between the foci and the Stub Conference is activated.

Then the main focus adds the remote user B_1 to the conference and sends the new assigned “userID” encapsuled into a UserAdded Message by means of the established B_1’ channel. User B_1 is now in the conference.
DCON: protocol dispatching and local mixing
If local user A sends a BFCP request, the Gateway directly forwards it to the main FCS. After the chair’s decision the FCS sends the response.

If remote user C sends a BFCP request, the Gateway forwards it to the main FCS by means of the dispatcher through the C-s2s-C’ channels.
We suppose audio floor is granted to all participants. C and D will send theirs audio flows to local focus that, after FCS controls, will mix and forward them through the RTP channel.
The main focus will mix the received mixed flow (C-D) with the local user’s flows and will send back the resulting mixed flow to the local users and to the remote focus (through the RTP channel). The remote focus then will spread the received mixed flow (A-B-C-D) to its users.
We suppose audio floor isn’t granted to user D but her/his softphone is BFCP unaware so it however sends the audio flow. C and D will send theirs audio flows to local focus that, after FCS controls, will forward only the granted user flow.
The main focus will mix the received flow (C) with the local user’s flows and will send back the resulting mixed flow to the local users and to the remote focus (through the RTP channel). The remote focus then will spread the received mixed flow (A-B-C) to its users.
Testing DCON: Scalability

- The maximum number of participants linearly grows with the number of DCON islands
Testing DCON: Performance

- 2 islands

Market overview

- From the lab to the real world: research becomes progress
- Gartner group prediction:
  - The market for *Web Conferencing* and *Collaboration Tools* will grow at a compound annual rate of 23% through 2011
- Main cost benefits
  - Savings on business travels
  - Efficient enterprise communications
    - Improving and simplifying collaboration activities
- Other valuable benefits
  - Environmental concerns and initiative for “Green IT”
    - $\text{CO}_2$ emission reduction
  - Travel stress decrease
Market needs

● MUST features:
  ● Presentation delivery
  ● Desktop/screen sharing
  ● Text chat
  ● Shared whiteboard
  ● Basic security
  ● Remote control

● More advanced features:
  ● Integrated PSTN audio
  ● Integrated Voice over IP audio
  ● Live video
  ● File sharing
  ● Application/document sharing
  ● Advanced security
  ● Archiving
  ● Feedback
  ● Polls and surveys
  ● E-learning
  ● Mobility support
Meetecho spin off

- Open-source, Java-based, multiplatform client
- Features:
  - Presentation delivery
  - Desktop/screen sharing
  - Text chat
- More advanced features:
  - Integrated PSTN audio
  - Integrated Voice over IP audio
  - Live video
  - File sharing
    - Application/document sharing
    - Advanced security
  - Shared whiteboard
  - Basic security
  - Remote control
  - Archiving
  - Feedback
  - Polls and surveys
  - E-learning
  - Mobility support
Meetecho in action
Meetecho: mobile access

- Client for Symbian S60 fp2
- Protocols
  - eXtensible Messaging and Presence Protocol (XMPP)
  - Session Initiation Protocol (SIP)
  - Real-time Transport Protocol (RTP)
- Features
  - Retrieves DCON conference information and events
  - Audio
    - Sends and receives
  - Video
    - Receives mixed flows
